## 1 Lattice Surgery

### 1.1 HERE Code

#### 1. Shapes

- Textbook shape d=7: 7×7 physical qubits

```
  ^  ^  ^
XOXOXO>
<OXOXOX
XOXOXO>
<OXOXOX
XOXOXO>
<OXOXOX
  v  v  v
```

- (more)

#### 2. **MORE** "Logical contributions" of physical qubit neighborhoods

- In the bulk:  $1-(1/4+1/4+1/4+1/4) = 0$

- 0 X
  - .
  - X 0
- On an edge:  $1-(1/4-1/4-1/2) = 0$ 
  - X
  - .
  - 0 >
- Convex corner :  $1-(1/4-1/2) = 1/4$ 
  - ^
  - .
  - 0 >
- etc
- etc
- etc

## 1.2 TODO Memory

### 1.2.1 Syndrome measurement

### 1.2.2 Decoding

### 1.2.3 Fixing

## 1.3 HERE Operations

### 1.3.1 MORE Single qubit Clifford gates

#### 1. Pauli-{X,Z} gates

**Transversal** (Only if length of observable is odd)<sup>1</sup>

- Space-time cost: Time = 1 cycle
- Error cost:
  - **Z**: with *virtual* Z-gate: 0
  - **X**, **Z** w/o virtual Z-gate: loads of 1-qubit gates

**Virtual P** Flip *frame* of every physical qubit & **propagate**

- ??? This doesn't look like it makes any sense...

**Virtual L** Flip sign of logical op<sup>1</sup>

#### 2. Pauli-Y gate

**Transversal** (Only if lengths of Z,X observables are both odd)<sup>1</sup>

Apply  $\rightarrow Z \rightarrow X \rightarrow$  or  $\rightarrow X \rightarrow Z \rightarrow$ ; e.g., **X{virt}**, **Ztrans**

- difference is global phase
- can be done in parallel

---

<sup>1</sup>arXiv:2307.03233 "Compilation of a simple chemistry application" (Riverlane)

### 1.3.2 HERE State preparation

#### 1. MORE $\pm Z$ , $\pm X$

- $+\sigma$  where  $\sigma \in \{Z, X\}$ :  
for q in dataqubits:  
    q.init( $+\sigma$ )  
EC(d times)

TODO There's sure to be a shortcut for preparing  $-Z$  and  $-X$

#### 2. TODO $\pm Y$

## 2 Footnotes = Bibliography

1. Riverlane <sup>1</sup>
